An agent-based model (ABM) is a class of computational models for simulating the actions and interactions of autonomous agents (both individual or collective entities such as organizations or groups) with a view to assessing their effects on the system as a whole. It combines elements of game theory, complex systems, emergence, computational sociology, multi-agent systems, and evolutionary programming.

Through an analogy between the individual actors involved in organizational routines and a specific type of active agents, we offer a multi-agent based simulation model via Swarm package (Swarm development Group [SDG] 2000), and achieve the visualization and reproduction of both the ostensive and performative aspects of organizational routines with the aid of computer tools. Next, we present the simulation results for variant concrete situations, and discuss factors such as the network ...

For each category, one or several business applications are described and analyzed. In agent-based modeling (ABM), a system is modeled as a collection of autonomous decision-making entities called agents. Each agent individually assesses its situation and makes decisions on the basis of a set of rules.
