Morphogenesis (from the Greek morphê shape and genesis creation, literally "the generation of form") is the biological process that causes a cell, tissue or organism to develop its shape. It is one of three fundamental aspects of developmental biology along with the control of tissue growth and patterning of cellular differentiation.. The process controls the

Here, we review recent studies on the roles and mechanisms of the chromodomain-helicase-DNA-binding (Chd) family of chromatin remodeling enzymes in the regulation of neuronal

The proper formation and morphogenesis of dendrites is

fundamental to the establishment of neural circuits in the brain.

Following cell cycle exit and migration, neurons undergo organized

stages of dendrite morphogenesis, which include dendritic arbor growth and elaboration followed by retraction and pruning. Although

these developmental stages were characterized over a century ago, molecular regulators of dendrite morphogenesis have only recently been defined.
