Obesity Its Relation To Periodontitis

While poorly understood, an imbalance between the host's immune and inflammatory systems likely plays a significant role in both obesity and periodontitis. 6,12 Several biological effects of obesity seem to relate to the pathogenesis of periodontitis. In particular, inflammatory cytokines—such as interleukins (IL) and tumor necrosis factor (TNF)—play a role in each disease.

The Relationship Between Obesity and Periodontal Diseases

The high incidence of obesity and the close relationship between obesity, periodontal and dental management makes this an important issue. This book, (OBESITY: ITS RELATION TO PRIODONTITIS AND DENTAL CARIES) is therefore an unusual and stimulating surprise to the reader.

Smoking and obesity are independent risk factors for periodontitis, and both show a doseresponse relationship to periodontal disease risk. 23 Radiographic periodontal bone loss is strongly associated with obesity among females and among nonsmokers. 24 Obese female nonsmokers are 3.4 times more likely to have periodontitis than those who have a normal BMI. 25 BMI and periodontitis are positively associated among the nonsmoking, nondiabetic population aged 30 years to 49 years. 26 This ...

Obesity is a risk factor associated with diabetes, periodontal diseases, and cardiovascular diseases [5]. A study conducted by Robert J et al. [38] found the relationship of BMI with periodontitis intensity (using CAL) and diabetes to be positive, with BMI being an indicator of obesity (p<0.01).

Relation between Periodontitis and Prediabetic Condition

Periodontal infection could aggravate the inflammatory state of the morbidly obese patient by increasing the plasma levels of orosomucoid and contribute to the development of obesity-related morbidity, such as atherosclerosis . More evidence is required to evaluate the association between periodontal diseases, obesity and cardiovascular diseases.

Periodontitis has been suggested to be linked to obesity and metabolic syndrome. Obesity, defined as excessive fat accumulation, is a complex multifactorial chronic inflammatory disease, with a high and increasing prevalence. Metabolic syndrome is defined as a cluster of obesity, dyslipidemia, hypertension, and dysglycemia.

Generally, several systematic reviews and meta-analyses have found a relation between obesity and periodontal diseases. 1, 3, 7 Prevalence of periodontal diseases has been shown to be higher in individuals with obesity compared to normal weight individuals and the relation tends to be stronger with increase in BMI levels. 8 Subjects with obesity have exhibited changes in dental biofilm microbial composition and an increase in inflammatory response by gingiva. 9 Furthermore, obesity could ...

BACKGROUND: Relationship among periodontitis, obesity, and chronic diseases may be multidirectional. Inflammatory diseases such as periodontitis induce the production of pro-inflammatory cytokines such as TNF-α, IL-1, and IL-6. It has been suggested that the secretion of TNF-α by adipose tissue triggered by
